Dr. Ramesh Kumar Thakur
Assistant Professor (II)
School Of Computer Engineering

Previous Year Question (Neural Network)

- ❖ 1. Implement AND function using McCulloch–Pitts neuron (take binary data). Consider the below given truth table for AND function.

X1	X2	Y
1	1	1
1	0	0
0	1	0
0	0	0

❖ Ans:

- Consider the truth table for AND function
- The M–P neuron has no particular training algorithm
- In M-Pneuron, only analysis is being performed.
- Hence, assume the weights be $w_1 = 1$ and $w_2 = 1$.

$$(1, 1), y_{in} = x_1 w_1 + x_2 w_2 = 1 \times 1 + 1 \times 1 = 2$$

$$(1, 0), y_{in} = x_1 w_1 + x_2 w_2 = 1 \times 1 + 0 \times 1 = 1$$

$$(0, 1), y_{in} = x_1 w_1 + x_2 w_2 = 0 \times 1 + 1 \times 1 = 1$$

$$(0, 0), y_{in} = x_1 w_1 + x_2 w_2 = 0 \times 1 + 0 \times 1 = 0$$

Threshold value is set equal to 2 ($\theta = 2$).

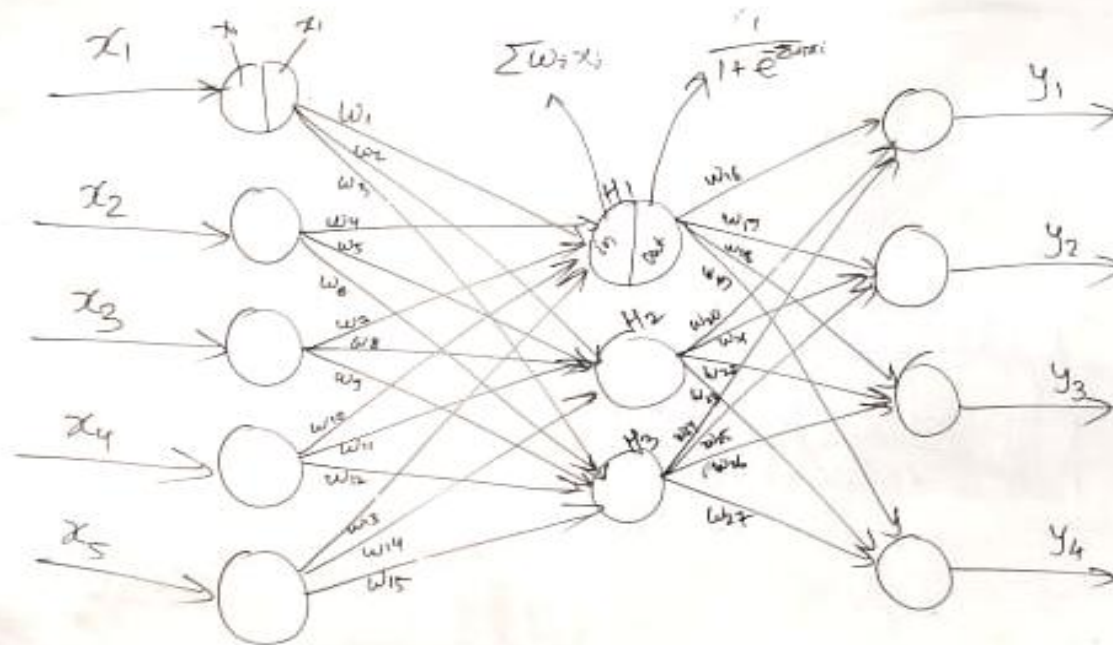

x_1	x_2	y
1	1	1
1	0	0
0	1	0
0	0	0

Previous Year Question (Neural Network)

- ❖ 1. Construct a feed-forward network with five input nodes, three hidden nodes and four output nodes with necessary mathematical expressions and explanations.

❖ Ans:

Let $\Phi = \text{Sigmoid}$

$$\Phi(x) = \frac{1}{1 + e^{-x}}$$

$$H_{1in} = x_1 w_1 + x_2 w_4 + x_3 w_7 + x_4 w_{10} + x_5 w_{13}$$

$$H_{1out} = \frac{1}{1 + e^{-H_{1in}}}$$

$$H_{2in} = x_1 w_2 + x_2 w_5 + x_3 w_8 + x_4 w_{11} + x_5 w_{14}$$

$$H_{2out} = \frac{1}{1 + e^{-H_{2in}}}$$

$$H_{3in} = x_1 w_3 + x_2 w_6 + x_3 w_9 + x_4 w_{12} + x_5 w_{15}$$

$$H_{3out} = \frac{1}{1 + e^{-H_{3in}}}$$

$$y_{1in} = H_{1out} w_{16} + H_{2out} w_{20} + H_{3out} w_{24}$$

$$y_{1out} = \frac{1}{1 + e^{-y_{1in}}}$$

Previous Year Question (Neural Network)

- ❖ 1. Draw an ANN architecture for 3 inputs, 2 hidden layer each with 2 neurons and one output. Derive the estimated output using sigmoid transfer function.
- ❖ Ans:

Previous Year Question (Neural Network)

- ❖ 1. Differentiate between linearly and non-linearly separable datasets. A two input single output neuron model has weights value $[-1.5 \ 2.0]$ and bias of -2.5 . It is given an input $[2.2 \ 3.1]$. What will be the output if the binary step function threshold=1 is used?

- ❖ Ans: $g(x) = 2.2 \times -1.5 + 3.1 \times 2.0 + (-2.5) = 0.4$

- ❖ $F(x) = \text{Binary step function}$

- ❖ $\text{Output} = F(g(x)) = F(0.4) = 0$

Previous Year Question (Neural Network)

- ❖ 1. Solve the problem: Use a Three-Input/Single-Neuron Perceptron with weights $w_{11}=1$, $w_{12}=0.5$ and $w_{13}=1$. Draw the perceptron, decision boundary and compute whether test sample $[-0.75 \ 0.9 \ 0.85]$ is cat (target class 0) or dog (target class 1). Use transfer function `hardlim()`.

- ❖ Ans:- Here $F(x) = \text{hardlim}()$
- ❖ For Cat case
- ❖ $g(x) = -1 \times 1 + 1 \times 0.5 + 1 \times 1 = 0.5$
- ❖ Output = $F(g(x)) = F(0.5) = 0$ (cat)
- ❖ For Dog case
- ❖ $g(x) = 1 \times 1 + 2 \times 0.5 + 2 \times 1 = 4$
- ❖ Output = $F(g(x)) = F(4) = 1$ (dog)
- ❖ From above two example, we can see that the threshold should be 1.
- ❖ For test sample
- ❖ $g(x) = -0.75 \times 1 + 0.9 \times 0.5 + 0.85 \times 1 = 0.55$
- ❖ Output = $F(g(x)) = F(0.55) = 0$ (cat)

Previous Year Question (Neural Network)

- ❖ 1. Design a three inputs, two layers with two-two neurons and one output ANN model with its input to output relationship using $F()$ as an activation function.
- ❖ Ans:-

Previous Year Question (Neural Network)

- ❖ 1. b) Derive Back propagation algorithm for a NN having 3 inputs, 2 hidden layers each having three neurons and output layer having two neurons. You may ignore the bias term. Sigmoid is used as the activation function in the network. [2+6]
- ❖ Ans:-

Thank you
